Questions

1. Q: "How did you pick and evaluate the plan to use for the implementation generation?"

A: I evaluated the plans based on their **constraint density**. My goal was to move away from generic descriptions and toward a "System Architecture" approach. I looked for plans that strictly defined the state machine, performance limits (60 FPS), and mobile-responsive UI margins to ensure the AI had a clear technical roadmap rather than just a creative one.

2. Q: "How did you pick the initial implementation version you modified to create the final playable?"

A: I used a two-step evaluation. First, a **code-read** to check if the AI followed the FSM and global state object rules. Second, a **functional test** to check the "feel" of the pendulum gauge. I chose the version that had the most stable core loop, even if it had minor UI bugs, as those are easier to "vibe-code" and polish manually than fixing a broken architecture.

3. Q: "Describe the process you followed for this task."

A: My process was iterative. I started with a general planning prompt, tested the implementation, and then refined the prompts based on gaps between the PRD and the results. I added constraints, clarified technical requirements, and introduced rules to prevent repeated issues. I repeated this loop until the output became consistent. Finally, I focused on fixing and polishing using a mix of targeted AI prompts and manual adjustments. The full breakdown is documented in the Task Progress above.

4. Q: "Describe how much time approximately you spend on planning generation, implementation generation and on the fixes to get the final playable version."

A: Overall this project was between 4.5-5 hours. I worked on the "Planning" and "Implementation" stages something like 4 hours (most of the time was on the Planning) and the rest of the time I was working on the fixing the playable it self.

Task progress

The goal of this file was to organize all my thoughts and the progress as best as possible on each step in this task.

This is organized according to the order I worked.

Planning - v1

About

AI: ChatGPT

URL: <https://chatgpt.com/share/69f452cc-acb4-8328-a076-b1a0192403ac>

Thought Before:

I created this prompt manually. My main goal was to build a general template prompt with placeholders for the PRD. I chose to force the game to be in 2D using because the load time is faster (especially on mobile). I chose to use the Phaser library is a cause this is a simple library I know well and its easy to go over it if there is any bug and fix them manually. I focused on explaining the organizational structure to the AI, using my previous experience with "template prompts" to cover common problematic elements.

Review After:

Overall, the result looked promising but a bit rough. I wanted to see what the AI would produce with a generic prompt so I could refine the logic later. One thing I liked was the addition of "fallback logic" to cover missing or unclear information in the PRD.

Implementation - V1

About

AI: ChatGPT

URL: <https://chatgpt.com/share/69f0fd34-446c-8325-b807-7a415d19883f>

Github: <https://github.com/idont12/Sett-AI-Game-Engineer-Task-Yarden-Zilberman/tree/ec5ece096b90f433e70a8584bd2572da902552a5>

Thought Before:

I used the output from [Planning - v1](#) and pasted the full PRD into the placeholder. This was a "feel test" to see how the AI responded.

Review After:

It was a decent start, but the game didn't function well. The prompt was too generic and didn't expand on the PRD enough to guide the AI toward the desired mechanics. The AI also tried to use heavy background images and too many assets, which would hurt mobile load times.

Planning – v2

About:

AI: ChatGPT

URL: <https://chatgpt.com/share/69f0fc91-f224-8330-b2a2-4fcf867cb7b3>

Thought Before:

I took the issues identified in [Implementation - v1](#) and modified my template. I realized that the prompt for the "initial implementation" didn't need to be a carbon copy of the PRD, it needed more specific engineering instructions.

Review After:

It was a good start, but ultimately it did not meet expectations. The game didn't work so well; the main reason for this was that the prompt was a bit too generic and didn't expand the PRD in a way that would guide the AI to make the desired game.

Implementation - V2

About

AI: ChatGPT

URL: <https://chatgpt.com/share/69f0fc91-f224-8330-b2a2-4fcf867cb7b3>

Github: <https://github.com/idont12/Sett-AI-Game-Engineer-Task-Yarden-Zilberman/tree/4f344f3a49651c709f41195e6846dbfd269ac3b3>

Thought Before:

I ran the refined plan from v2..

Review After:

Still not quite there. The main issue was the layout, it wasn't centered or organized in a way that felt "playable" on a mobile screen.

Planning – v3

About:

AI: ChatGPT

URL: <https://chatgpt.com/share/69f11471-524c-8326-971b-0aed65ce7c75>

Thought Before:

I made a major fix: I removed the instruction to "generate HTML" from the planning prompt stage to prevent the AI from getting ahead of itself. I also noticed that some fallback rules

conflicted with the PRD, so I rewrote them to ensure the PRD always took priority. I added rules for low-resolution assets to ensure fast loading.

Thought After:

The result was much better. The first output felt a bit generic, so I asked the AI to focus more on technical aspects like the min-max-min pendulum slider, which is a specific PRD requirement that was previously ignored. The second output after my clarification fit better the prompt I was aiming for, but still there were several things I wanted to improve.

Implementation – V3

About

AI: ChatGPT

URL: <https://chatgpt.com/share/69f118fb-d6ec-83eb-b62c-eefa7dff4b53>

Github: <https://github.com/idont12/Sett-AI-Game-Engineer-Task-Yarden-Zilberman/tree/d7f838330f3d1fbbf888eba6c47e8a7c3fa75958>

Thought Before:

I used the planning from [Planning – v3](#) and past the full PSD in the available place.

Review After:

Overall the result looks really good. But there are several problems, like the main play button is hidden in the "Gauge," the animation can be long and make you wait a lot of time, and so on...

Planning – v4

About:

AI: ChatGPT

URL: <https://chatgpt.com/share/69f39188-f5ec-832e-95d5-9d31b6b93ac7>

Thought Before:

I improved the initial prompt by adding more "fallback rules" to fill PRD gaps. I instructed the AI to be more technical, breaking the game flow into small, manageable mechanics.

Review After:

The format was solid, but I realized the AI needed the prompt in a cleaner Markdown (MD) format to process the instructions better. I manually edited the result to ensure the "Play" button text appeared correctly, removed unnecessary whitespace to save tokens, and stripped out emojis to keep the AI focused on the code logic.

Implementation – V4

About

AI: Gemini

URL: <https://gemini.google.com/share/04274a867984>

Github: <https://github.com/idont12/Sett-AI-Game-Engineer-Task-Yarden-Zilberman/tree/94337834d4f9a7ea312d189ad2b0cea6044de1af>

Thought Before:

I used the plan from [Planning - v4](#) and switched to Gemini to see if its coding logic differed.

From this “Implementation” and so on I switched to “Gemini” the main reason was that I run the promote in ChatGPT and the result as a bit lacking (maybe because I already use most to my tokens there).

Review After:

The game was looking really good and I choose to go with this implementation for the fixing section so the task. I did it cause it include all the main things the game should have with several small bugs and unclear animation.

Fix and iteration V1 & V2

About:

V1: AI: Gemini

URL: <https://gemini.google.com/share/bcd1798b6617>

Github: <https://github.com/idont12/Sett-AI-Game-Engineer-Task-Yarden-Zilberman/tree/3c74e4326bffa15fde7b757e280e4bd4c251fb34>

V2: AI: Gemini

URL: <https://gemini.google.com/share/f71aab0131c2>

Github: <https://github.com/idont12/Sett-AI-Game-Engineer-Task-Yarden-Zilberman/tree/3c7a1420439e7b06d48ea9c21d9155c9e5c8b6f6>

Process:

During these final stages, I focused on "stabilizing" the game. I fixed small bugs in the animation timing and ensured the UI transitions weren't too long, as long wait times hurt the "playable" experience. I used a combination of specific AI prompts and manual code adjustments (vibe-coding) to reach the final result.
